

TASK 1

Option 3: something I'm actively Trying to get better at : LEARNING AI and ML

Hello SOF team, I am a AI and ML student. I am trying to improving my focus and time management while learning AI and ML.

In the beginning of my self learning in ML .I often spend long time for learning but sometimes get distracted. Also sometimes feel I not on right track ,feeling like not doing in meaningful way. So this cause sometimes several hours of study make not sense.

So after that I break my learning into small ,focused session and make small daily goals. I try to improve my coding skills and avoid random learning make me structured.

On that days it was hard to do .I feel struck on learning and routine. On that days I understand its hard to be consistent. Some days some distraction also wins and feel frustrated.

After that frustration ,i try to improve myself daily .Try to consistent ,not being distracted ,try to put my full effort in learning. Thus currently I doing more than 5 projects in ml .Also this days I am try to improve it.

TASK 2

Option 1:One problem I notice Around Me: students struggling to apply AI & ML knowledge in real projects

Mostly of the students like me at the beginning stages struggles this problem. In most of the tutorial and also colleges teaching only theory part of the courses.

They don't showing the correct way to implement it. Therefore most of the students stuck in real life for this skills.

While i am at the learning , when i try to implement those in real world projects i also stuck many times. Many friends that I have also lose motivation because they don't know how to turn their knowledge into work.

After understanding this problem i collaborate with them while learning. Understand problems each other and helping each other.

In my thoughts ,the problem exists because there less structured and lack of guidance for beginners.
